Surgical Treatment

Gold standard treatment for patients in chronic phase

Indications

Stable disease (> 6 mo with no pain and stable deformity)

Inability to engage in coitus

Severe curvature or penile shortening

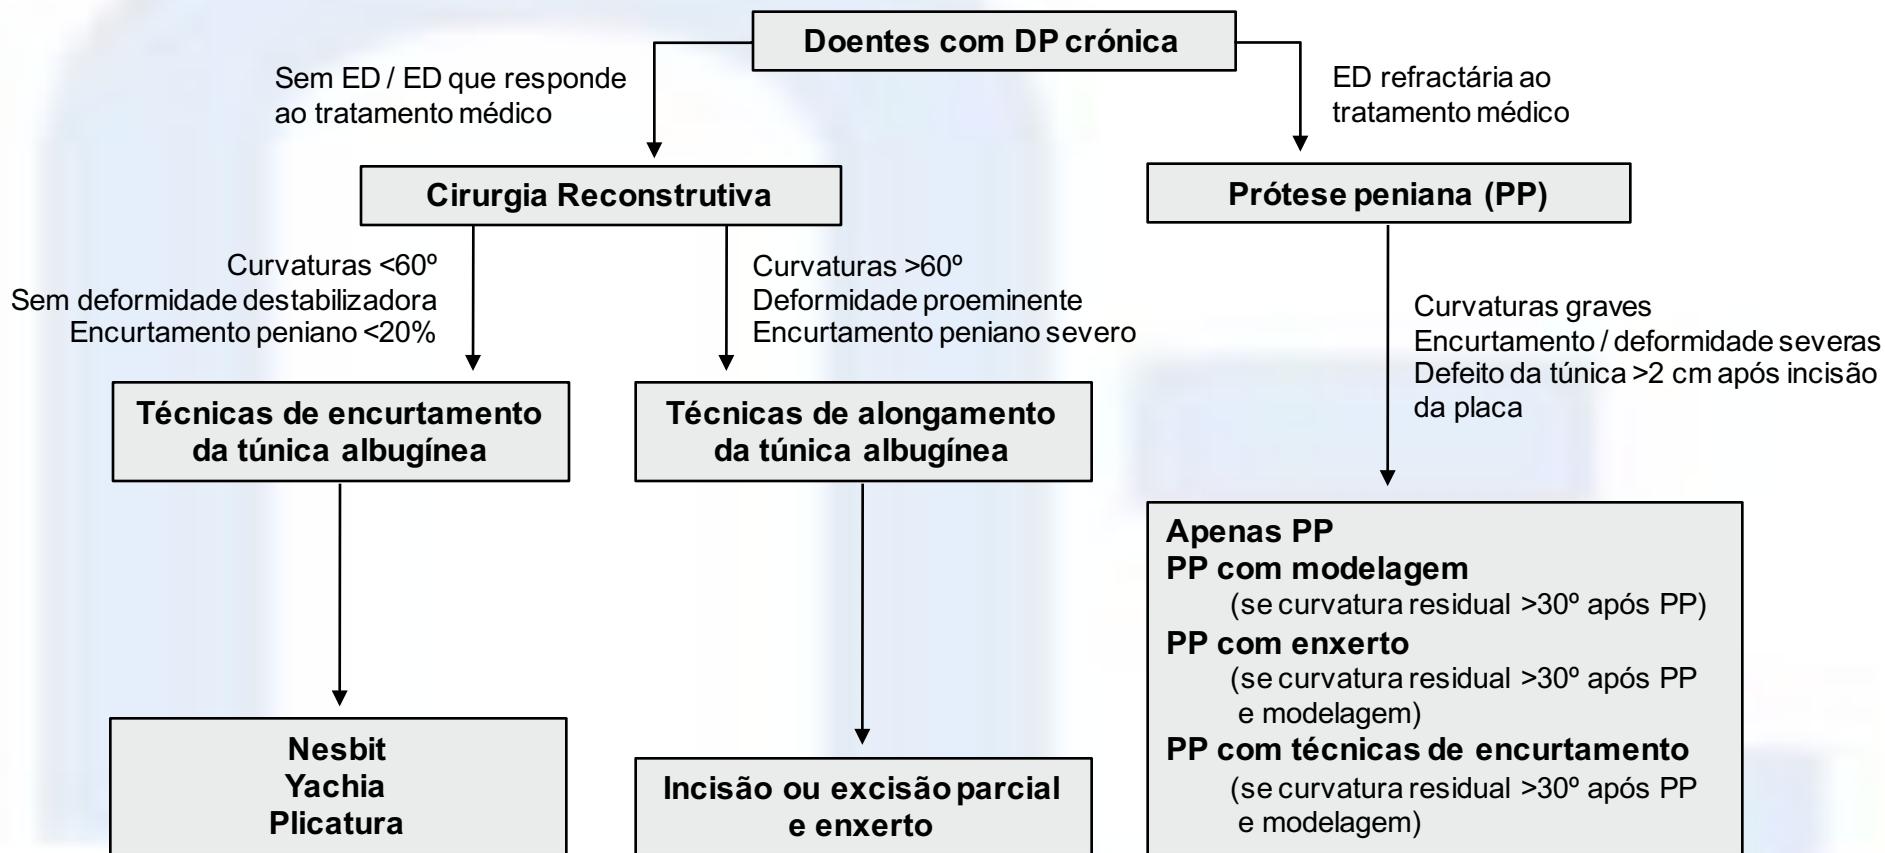

Extensive plaque calcification

Patient desire for rapid and reliable results

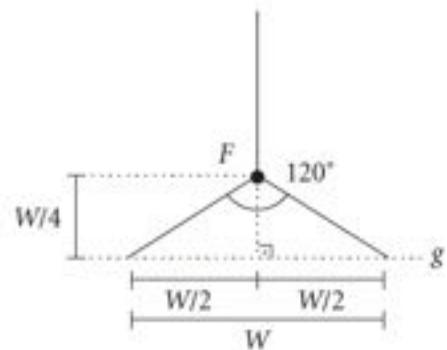

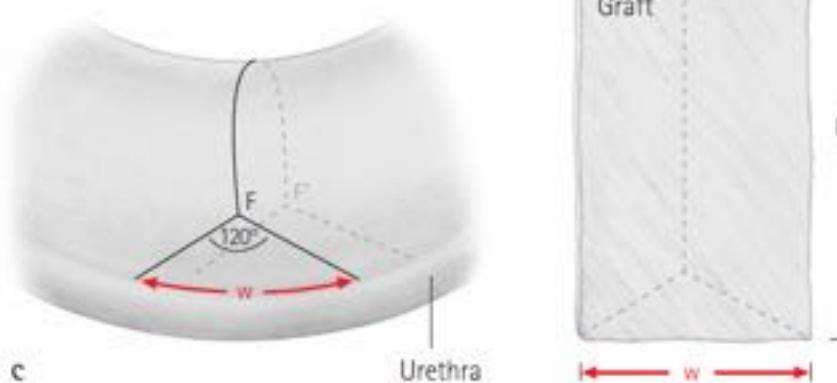

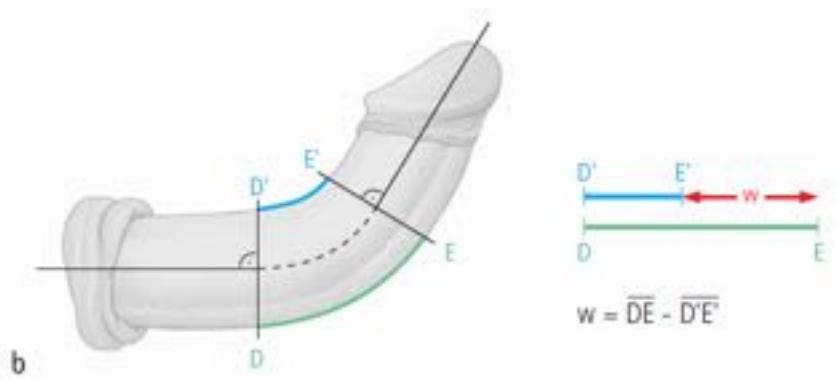

BUT ABSOLUTELY NECESSARY

Detailed preoperative discussion on cause and mechanism of action of PD *and*

Realistic outcomes of the selected surgical procedure (return of function rather than restoration to the pre-PD !

Corporoplastia de alongamento

Princípios geométricos Paulo Egydio

Corporoplastia de alongamento

Corporoplastia de alongamento

Situações especiais

Várias curvaturas - vários enxertos

Corporoplastia de encurtamento adicional

Grafts used in Peyronie's disease surgery

Autologous grafts

Dermis
Vein grafts
Tunica albuginea
Tunica vaginalis
Temporalis fascia
Buccal mucosa

Ideal graft material ??

Allografts

Cadaveric pericardium
Cadaveric fascia lata
Cadaveric dura matter
Cadaveric dermis

Xenografts

Porcine small intestinal submucosa
Bovine pericardium
Porcine dermis

Synthetic grafts

Gore-Tex
Dacron

Saphenous vein VS SIS®

Advantages:

Establishing blood supply from the lumen of corpus cavernosum

NO prevents hematoma formation.

Experimentally demonstrated that TA reforms over the vein patch site.

Acceptable long-term outcome.

Extended experience in centers of excellence

No additional cost

Disadvantages:

Morbidity of vein harvesting

Complex suturing

Time consuming

Future bypass surgery ?

Advantages:

No second incision needed

Easy to use

Rapid integration in the tissues

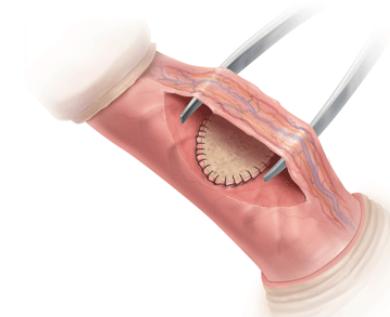

Acceptable medium-term outcome.

Extended experience in centers of excellence

Disadvantages:

Costs

De novo ED – controversial !

Post Grafting ED Predictors

Age > 55

Graft size

Curvature degree

Preoperative EF

Arterial dysfunction

Cavernosal dysfunction

Comorbidities (DM)

H vs Egydio

Outcome of Surgical Treatments

	Tunical shortening procedures		Tunical lengthening procedures
	Nesbit	Plication	Grafts
Penile shortening	4.7-30.8%	41-90%	0-40%
Penile straightening	79-100%	58-100%	74-100%
Persistent or recurrent curvature	4-26.9%	7.7-10.6%	0-16.7%
Post-operative erectile dysfunction	0-13%	0-22.9%	0-15%
Penile hypoesthesia	2-21%	0-21.4%	0-16.7%
Technical modifications	1	At least 3	Many types of grafts and techniques used

Postoperative care

Massage and stretch therapy 2 weeks after the surgery and performed twice a day for 4 weeks

Bedtime PDE-5 inhibitors begin 7-10 days after surgery and maintained for 6 weeks

External penile traction therapy is initiated 2-3 weeks after surgery and performed on a daily basis for a minimum of 2-8 hours for 3 months

moderate ED	2 (7,1)
severe ED	3 (10,7)
Response to ED medication	
normal EF with no need for medication	18 (64,2)
normal EF with medication	6 (21,4)
ED despite medication	4 (14,3)
Global satisfaction concerning sexual activity after surgery	
higher	18 (64,7)
same	5 (17,9)
lower	5 (17,5)

IIEF-5, International Index of Erectile Function; ED, Erectile Dysfunction; EF, Erectile Function; PDDU, penile duplex doppler ultrasound

RESULTS

Sexual function after surgery

Two patients had already ED with arterial dysfunction prior to surgery- de novo ED 7%.

Post-operative PDDU was performed on all patients with ED despite treatment, and none, including those with previous arterial insufficiency, showed objective arterial or venous dysfunction.

These data suggest that no vasculogenic etiology of ED seems to be present, and that other causes should be considered.

RESULTS

Patient satisfaction

Table 6 Patient satisfaction

Clinical Variables	No. of patients (%)
Global satisfaction with surgical outcome	
very satisfied	5 (39,3)
satisfied	12 (42,9)
mildly satisfied	4 (14,3)
unpleased	1 (3,6)
Meeting of expectations towards surgery	
fully achieved	22 (78,5)
moderately achieved	3 (10,7)
mildely achieved	3(10,7)
unachieved	0 (0)
Willingness to repeat procedure	
yes	22 (78,6)
no	6 (21,4)
Willingness to recommend procedure	
yes	22 (78,6)
no	6 (21,4)
